

Project Synopsis

MyFAANG is a cutting-edge web application that employs GPT-3 technology to create an immersive and tailored mock interview experience for job seekers. By allowing users to select their industry and job role, MyFAANG generates interview questions that are highly specific to the user's profession. Users receive personalized feedback on their performance after answering the questions, which includes actionable insights on areas that need improvement. Employers can access interview transcripts and performance metrics to streamline the hiring process. MyFAANG is developed using advanced technologies such as Python, React, Flask, and GCP. User authentication and registration is mandatory for access to the mock interview feature.
